

Miba Industrial Bearings ZF End Flange Mounted Bearing

Miba Industrial Bearings

The Industrial Bearing Branch of the Miba Bearing Group produces hydrodynamic bearings and labyrinth seals for use in mechanical and plant engineering which are used in a wide range of high-performance applications. Our highly inspired teams, work diligently to serve our customers the best bearing solutions for each and every application.

Checklist	15

Description of the ZF design

The type ZF horizontal bearing is designed according to DIN 31 693 norm specifications for a wide range of heavy duty applications (electrical machines, turbines and test rigs). The modular system applies to the different types of bearings (pedestal, end flange and center flange), i.e. it is always possible to combine different modules of this system. Thus, assembly is simple and mistakes due to the positioning of screws and pins are avoided during installation, commissioning and maintenance procedures.

Housing

The bearing housings are finned and manufactured from nodular cast iron EN-GJS-400-15 (formerly GGG 40) giving high strength. Upon request, they can be supplied in gray cast iron EN-GJL-300 (formerly GG 30) or in nodular cast iron EN-GJS-400-18-LT (formerly GGG 40.3).

The spherical seat in the housing ensures easy alignment during assembly and the loads are evenly distributed into the lower part of the housing. Therefore, these bearings are designed for highest stress applications. Thread holes for monitoring the temperature, for oil inlet and outlet, as well as for oil level, are provided on both sides of the housing as standard. The housing comes with an

oil sight glass on one side. The opposite side is supplied plugged and may be used as an oil outlet. If needed, their positions can be exchanged by reversing these parts. In the top half of the housing, a sight glass, which permits the loose oil ring to be viewed, and a plugged manual oil feeder are provided. The basic design can be easily amended, if required, to incorporate water cooling tubes, oil sump heater, vibration detectors (angled at 45°), horizontal, vertical and axial vibration sensors and earthing devices. Upon request, thread holes can be provided in the ZF housing to meet all 541 and 546 requirements for API norms.

Bearing shells

The shell is supplied in halves and spherically seated in the housing, ensuring easy self-alignment during assembly. The material is low carbon steel, lined with high tin-based white metal. This construction ensures an easy assembly and a long life cycle. Bearing shells with plain cylindrical bore and loose oil ring are used in most cases, but other shapes of bore are possible. When the specific load on start-up is too high, or for very slow-speed applications, a hydrostatic jacking system can be incorporated. Bearing shells can be provided with or without thrust faces.

-
- Q-type shells have no thrust capability for non-locating bearings.
- B-type shells with plain white metal lined shoulders with oil grooves are suitable for small, temporary thrust loads.
- K-type shells have taper land faces for medium thrust loads and both directions of rotation.
- D-type shells, with taper land faces suitable for only one direction of rotation, are capable of absorbing higher thrust loads.
- A-type shells, for the highest loads, are equipped with thrust tilting pads.
-

Oil supply

Fully self-contained lubrication is achieved by using a loose oil ring. Alternatively, where bearings are lubricated by an external oil circulation system, this loose oil ring can be used to permit an emergency shutdown without damage in case an oil system failure occurs. Z-bearings can be used for marine applications, where an oil ring guide assures proper lubrication even if extreme vessel motions occur.

Electrical insulation

To prevent stray currents conducted by the shaft, Z-bearings can be supplied electrically insulated as an option. In this case, the spherical seat of the housing is coated with a wear-resistant and temperature-resistant synthetic material. Upon request, a grounding wire is provided to short out this insulation, passing through a thread hole (M12x1.5) in the housing.

Sealing

The seals are selected for the different operation conditions and environments and for the requested protection level. The standard arrangement is the floating labyrinth seal (IP 44) made of high heat resistant, fiber-reinforced synthetic material. Bearings for high oil throughput are equipped with adjustable rigid seals (IP 44) made of aluminium alloy. Both types of seals can be equipped with bolt-on baffles (IP 55) or dust flingers (IP 54) if the bearing is operating in a dusty or a wet environment, or if rotating parts (clutches, couplings, fans etc.) are fitted close to the bearing. Special seals offering higher protection, or pressurized seals etc., can be supplied for special applications upon request. An end cover is used when the end of the shaft is inside the bearing housing.

Temperature control

Provisions for the fitting of thermo sensors in the journal bush and oil sump are provided as standard. The type of sensor to be used depends on the type required by the readout equipment used (direct reading, centralized control system, recording instrument, etc.). For bearings with high thrust loads, additional thermometers for the thrust part can be integrated.

Machine seal

Where negative or positive pressures occur near the internal floating seals ZF bearings should be used with an additional machine seal to avoid interference from inside the machine. This machine seal is fitted to the inside of the machine housing, creating a chamber between the machine seal and the bearing seal. To equalize the pressure, the chamber is connected to atmosphere, which prevents oil leakage from the bearing into the machine enclosure.

Selection of oil

It is recommended that any branded mineral oil which is inhibited against foaming, ageing and oxidation is used as lubricant. The viscosity is suggested by Miba Industrial Bearings if the customer doesn't have preferences.

Bearing calculation

Miba Industrial Bearings uses a state of the art calculation program which can provide the following outputs:

- Minimum oil film thickness
- Maximum hydrodynamic pressure
- Maximum bearing temperature
- Oil outlet temperature
- Minimum permissible oil flow
- Frictional power loss
- Stiffness and damping coefficients
- Clearance for bearing / shaft seat

Radial bore profile selection

The radial bore profile type selection depends on several conditions. Among them we have the circumferential speed and the specific pressure. The following table should help in a preliminary selection.

1 // Type of radial bearing bore profile		
Type of bore	Circumferential speed U (m/s)	Specific load p (MPa)
C/L/F Cylindrical	0 ... 30	0 ... 4
Y Two-lobe	25 ... 75	0 ... 3
V Four-lobe	25 ... 100	0 ... 2
K Radial tilting pads	15 ... 100	0 ... 2

4 tilting pads

5 tilting pads

- MIBA housing bearings of all sizes 9- 45 can be provided with tilting pad journal bearings for the highest demands
- Very high load capacity at highest circumferential speeds up to 100 m/s
- Highest stability properties

Oil flow

Z-bearings are supplied without oil inlet or outlet flanges. Upon request, as additional items, Miba Industrial Bearings can supply these flanges according to DIN 2573 or ANSI B16.5 norms. Oil outlet flanges with weir are to be mounted with the weir horizontal at the bottom. The mark on the flange will then be visible in the center of the top side.

Larger oil quantities with special outlets on request.

1// Oil Flow						
Size	Oil outlet thread Std	Maximum flow for oil ISO VG 32 and 46 at 40°C (l/min)	Maximum flow for oil ISO VG 68 and 100 at 40°C (l/min)	Oil outlet thread enlarged*	Maximum flow for oil ISO VG 32 and 46 at 40°C (l/min)	Maximum flow for oil ISO VG 68 and 100 at 40°C (l/min)

Dimensions in millimeters

- ¹⁾ Limit dimensions of the shaft acc. DIN 31 698, form and positional tolerance and surfaces roughness acc. to DIN 31 699.
- ²⁾ Standard thrust clearance is 0,5 mm. If reversible thrust loads or shock load occur, dimension b20 can be reduced by 0,2 mm. If a locating bearing (shell type B,K) is needed only for test runs, dimension b20 can be enlarged by 4 up to 6 mm.
- ³⁾ If the non-locating bearing must allow larger motions (due to heat expansion or to large thrust clearances caused by the unit), dimension b21 can be enlarged.
- ⁴⁾ Dimension b23 is valid for a bearing with a floating labyrinth seal.
- ⁵⁾ Diameter d35 can be combined with every shell of dia. D within one size.
- ⁶⁾ Radii R1 and R2 can be replaced by a plunge cut acc. to DIN 509.

Example of a bearing designation:

Z F N L B - 11 - 125

End flange mounted, finned bearing, naturally cooled by convection, plain cylindrical bore with loose oil ring, plain white metal lined shoulders with oil grooves (locating or non-locating bearing), size 11, for shaft diameter 125 mm technology, mechanical engineering elements and steel profiles.

ZM - Center flange bearing

The type ZM horizontal bearing is designed acc. to DIN 31 694 norm specifications for a wide range of heavy duty applications (electrical machines, turbines and test rigs)

ZR - Pedestal bearing

The type ZR horizontal bearing is designed acc. to DIN 31 690 norm specifications for a wide range of heavy duty applications (electrical machines, turbines, blowers and test rigs)
